

#### NAME

autodie::exception::system - Exceptions from autodying system().

## **SYNOPSIS**

```
eval {
    use autodie qw(system);
    system($cmd, @args);

if (my $E = $@) {
    say "Ooops! ",$E->caller," had problems: $@";
}
```

# **DESCRIPTION**

This is a *autodie::exception* class for failures from the system command.

Presently there is no way to interrogate an autodie::exception::system object for the command, exit status, and other information you'd expect such an object to hold. The interface will be expanded to accommodate this in the future.

## stringify

When stringified, autodie::exception::system objects currently use the message generated by IPC::System::Simple.
