

NAME

IPC::SharedMem - SysV Shared Memory IPC object class

SYNOPSIS

```
use IPC::SysV qw(IPC_PRIVATE S_IRUSR S_IWUSR);
use IPC::SharedMem;

$shm = IPC::SharedMem->new(IPC_PRIVATE, 8, S_IRWXU);

$shm->write(pack("S", 4711), 2, 2);

$data = $shm->read(0, 2);

$ds = $shm->stat;

$shm->remove;
```

DESCRIPTION

A class providing an object based interface to SysV IPC shared memory.

METHODS

```
new (KEY, SIZE, FLAGS)
```

Creates a new shared memory segment associated with KEY. A new segment is created if

- KEY is equal to IPC_PRIVATE
- KEY does not already have a shared memory segment associated with it, and FLAGS
 IPC_CREAT is true.

On creation of a new shared memory segment FLAGS is used to set the permissions. Be careful not to set any flags that the Sys V IPC implementation does not allow: in some systems setting execute bits makes the operations fail.

id

Returns the shared memory identifier.

```
read (POS, SIZE)
```

Read SIZE bytes from the shared memory segment at POS. Returns the string read, or undef if there was an error. The return value becomes tainted. See *shmread*.

```
write (STRING, POS, SIZE)
```

Write SIZE bytes to the shared memory segment at POS. Returns true if successful, or false if there is an error. See *shmwrite*.

remove

Remove the shared memory segment from the system or mark it as removed as long as any processes are still attached to it.

is_removed

Returns true if the shared memory segment has been removed or marked for removal.

stat

Returns an object of type IPC::SharedMem::stat which is a sub-class of Class::Struct . It provides the following fields. For a description of these fields see you system

```
documentation. uid
gid
cuid
cgid
mode
segsz
lpid
cpid
nattach
atime
dtime
ctime
```

attach ([FLAG])

Permanently attach to the shared memory segment. When a IPC::SharedMem object is attached, it will use *memread* and *memwrite* instead of *shmread* and *shmwrite* for accessing the shared memory segment. Returns true if successful, or false on error. See *shmat*.

detach

Detach from the shared memory segment that previously has been attached to. Returns true if successful, or false on error. See *shmdt*.

addr

Returns the address of the shared memory that has been attached to in a format suitable for use with pack('P'). Returns undef if the shared memory has not been attached.
