

#### NAME

Pod::Simple::PullParserEndToken -- end-tokens from Pod::Simple::PullParser

## **SYNOPSIS**

(See Pod::Simple::PullParser)

### DESCRIPTION

When you do \$parser->get token on a *Pod::Simple::PullParser*, you might get an object of this class.

This is a subclass of *Pod::Simple::PullParserToken* and inherits all its methods, and adds these methods:

\$token->tagname

This returns the tagname for this end-token object. For example, parsing a "=head1 ..." line will give you a start-token with the tagname of "head1", token(s) for its content, and then an end-token with the tagname of "head1".

\$token->tagname(somestring)

This changes the tagname for this end-token object. You probably won't need to do this.

\$token->tag(...)

A shortcut for \$token->tagname(...)

\$token->is\_tag(somestring) or \$token->is\_tagname(somestring)

These are shortcuts for \$token->tag() eq somestring

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call Pod::Simple::PullParserEndToken->new( tagname )
