

#### NAME

if - use a Perl module if a condition holds

### **SYNOPSIS**

```
use if CONDITION, MODULE => ARGUMENTS;
```

# **DESCRIPTION**

The construct

```
use if CONDITION, MODULE => ARGUMENTS;
```

has no effect unless CONDITION is true. In this case the effect is the same as of

```
use MODULE ARGUMENTS;
```

Above => provides necessary quoting of MODULE. If not used (e.g., no ARGUMENTS to give), you'd better quote MODULE yourselves.

#### **BUGS**

The current implementation does not allow specification of the required version of the module.
